Resume Builder Project: Tool Selection Review

- **VS Code**: a fast lightweight text editor, when used in conjunction with vscode extensions it gives and IDE like experience for any language i choose to work with

- **Front End**: I will be using the Bootstrap library because it allows for easy implementation of responsive styling for use on mobile. Ejs allows me to inject js code and logic directly into my html pages. JS will be my main language used because this will be a web based application

- **Backend**: I will be using Nodejs and Express for the backend because it will allow me to use familiar, easy to read and maintain js syntax to create my server and handle all my routing and api calls. I will Also be using firebase for its simple and secure user authentication as well as its firestore database technology which will be used to store user resumes
